Washington State Institute for Public Policy

Benefit-Cost Results

Multidimensional Treatment Foster Care Juvenile Justice

Benefit-cost estimates updated December 2016. Literature review updated June 2014.

Current estimates replace old estimates. Numbers will change over time as a result of model inputs and monetization methods.

The WSIPP benefit-cost analysis examines, on an apples-to-apples basis, the monetary value of programs or policies to determine whether the benefits from the program exceed its costs. WSIPP's research approach to identifying evidence-based programs and policies has three main steps. First, we determine "what works" (and what does not work) to improve outcomes using a statistical technique called meta-analysis. Second, we calculate whether the benefits of a program exceed its costs. Third, we estimate the risk of investing in a program by testing the sensitivity of our results. For more detail on our methods, see our Technical Documentation.

Program Description: Multidimensional Treatment Foster Care (MTFC) is an intensive therapeutic foster care alternative to institutional placement for adolescents who have problems with chronic antisocial behavior, emotional disturbance, and delinquency. MTFC activities include skills training and therapy for youth as well as behavioral parent training and support for foster parents and biological parents. The length of the program varies for each youth depending on their age, when they obtain a permanent placement or are reunited with the biological family, or are no longer under the jurisdiction of the Juvenile Rehabilitation Administration.

In our analysis, we only include effect sizes from programs that were delivered competently and with fidelity to the program model.

Benefit-Cost Summary Statistics Per Participant								
Benefits to:								
Taxpayers	\$4,168	Benefit to cost ratio	\$1.70					
Participants	\$873	Benefits minus costs	\$5,815					
Others	\$11,130	Chance the program will produce						
Indirect	(\$2,074)	benefits greater than the costs	61 %					
Total benefits	\$14,097							
Net program cost	(\$8,282)							
Benefits minus cost	\$5,815							

The estimates shown are present value, life cycle benefits and costs. All dollars are expressed in the base year chosen for this analysis (2015). The chance the benefits exceed the costs are derived from a Monte Carlo risk analysis. The details on this, as well as the economic discount rates and other relevant parameters are described in our Technical Documentation.

Detailed Monetary Benefit Estimates Per Participant

Benefits from changes to:1	Benefits to:						
	Participants	Taxpayers	Others ²	Indirect3	Total		
Crime	\$0	\$3,613	\$10,640	\$1,806	\$16,058		
Labor market earnings associated with high school graduation	\$920	\$418	\$422	\$194	\$1,953		
K-12 grade repetition	\$0	\$23	\$0	\$11	\$34		
K-12 special education	\$0	\$90	\$0	\$45	\$135		
Property loss associated with alcohol abuse or dependence	\$1	\$0	\$2	\$0	\$3		
Health care associated with disruptive behavior disorder	\$23	\$71	\$88	\$36	\$219		
Costs of higher education	(\$71)	(\$47)	(\$22)	(\$23)	(\$163)		
Adjustment for deadweight cost of program	\$0	\$0	\$0	(\$4,143)	(\$4,142)		
Totals	\$873	\$4,168	\$11,130	(\$2,074)	\$14,097		

¹In addition to the outcomes measured in the meta-analysis table, WSIPP measures benefits and costs estimated from other outcomes associated with those reported in the evaluation literature. For example, empirical research demonstrates that high school graduation leads to reduced crime. These associated measures provide a more complete picture of the detailed costs and benefits of the program.

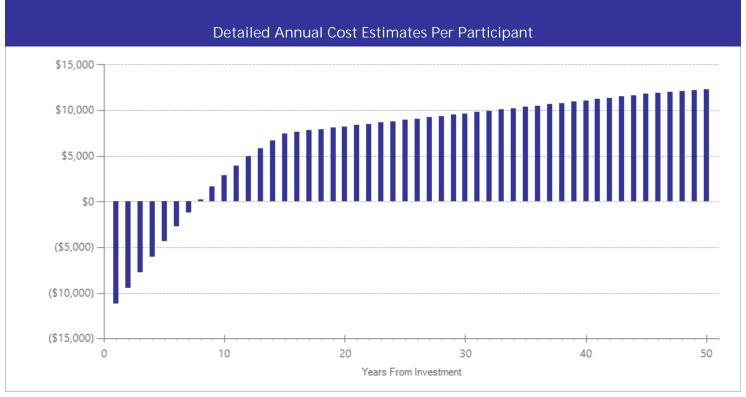

^{3&}quot;Indirect benefits" includes estimates of the net changes in the value of a statistical life and net changes in the deadweight costs of taxation.

Detailed Annual Cost Estimates Per Participant								
	Annual cost	Year dollars	Summary					
Program costs Comparison costs	\$31,883 \$24,536	2007 2007	Present value of net program costs (in 2015 dollars) Cost range (+ or -)	(\$8,282) 10 %				

The per-participant cost estimate provided by the Juvenile Rehabilitation Administration is based on an average length in the program during 2010 and includes oversight, coordination, and administration of the program. Aftercare programming for MTFC is discretionary and the additional associated cost calculation formulas are currently in development. The MTFC cost estimate is compared with alternative cost for youth in group homes.

The figures shown are estimates of the costs to implement programs in Washington. The comparison group costs reflect either no treatment as usual, depending on how effect sizes were calculated in the meta-analysis. The cost range reported above reflects potential variation or uncertainty in the cost estimate; more detail can be found in our Technical Documentation.

²"Others" includes benefits to people other than taxpayers and participants. Depending on the program, it could include reductions in crime victimization, the economic benefits from a more educated workforce, and the benefits from employer-paid health insurance.

The graph above illustrates the estimated cumulative net benefits per-participant for the first fifty years beyond the initial investment in the program. We present these cash flows in non-discounted dollars to simplify the "break-even" point from a budgeting perspective. If the dollars are negative (bars below \$0 line), the cumulative benefits do not outweigh the cost of the program up to that point in time. The program breaks even when the dollars reach \$0. At this point, the total benefits to participants, taxpayers, and others, are equal to the cost of the program. If the dollars are above \$0, the benefits of the program exceed the initial investment.

Meta-Analysis of Program Effects										
Outcomes measured	No. of effect sizes	Treatment N	cost analysis (random effects							n effects
			First time ES is estimated			Second time ES is estimated			model)	
			ES	SE	Age	ES	SE	Age	ES	p-value
Crime	3	81	-0.110	0.126	17	-0.110	0.126	27	-0.544	0.091
Teen pregnancy (under age 18)	1	134	-0.538	0.187	16	-0.538	0.187	18	-0.538	0.004
Externalizing behavior symptoms	1	20	-0.627	0.350	17	-0.299	0.221	20	-0.627	0.073
Internalizing symptoms	1	20	-0.428	0.346	17	-0.312	0.295	20	-0.428	0.216
Alcohol use in high school	1	32	-0.045	0.240	17	-0.045	0.240	19	-0.126	0.601
Smoking in high school	1	32	-0.068	0.240	17	-0.068	0.240	19	-0.190	0.429
Cannabis use in high school	1	32	-0.083	0.240	17	-0.083	0.240	19	-0.230	0.340
Illicit drug use in high school	1	32	-0.094	0.240	17	-0.094	0.240	19	-0.261	0.279

Meta-analysis is a statistical method to combine the results from separate studies on a program, policy, or topic in order to estimate its effect on an outcome. WSIPP systematically evaluates all credible evaluations we can locate on each topic. The outcomes measured are the types of program impacts that were measured in the research literature (for example, crime or educational attainment). Treatment N represents the total number of individuals or units in the treatment group across the included studies.

An effect size (ES) is a standard metric that summarizes the degree to which a program or policy affects a measured outcome. If the effect size is positive, the outcome increases. If the effect size is negative, the outcome decreases.

Adjusted effect sizes are used to calculate the benefits from our benefit cost model. WSIPP may adjust effect sizes based on methodological characteristics of the study. For example, we may adjust effect sizes when a study has a weak research design or when the program developer is involved in the research. The magnitude of these adjustments varies depending on the topic area.

WSIPP may also adjust the second ES measurement. Research shows the magnitude of some effect sizes decrease over time. For those effect sizes, we estimate outcome-based adjustments which we apply between the first time ES is estimated and the second time ES is estimated. We also report the unadjusted effect size to show the effect sizes before any adjustments have been made. More details about these adjustments can be found in our Technical Documentation.

Washington State Institute for Public Policy

The Washington State Legislature created the Washington State Institute for Public Policy in 1983. A Board of Directors-representing the legislature, the governor, and public universities-governs WSIPP and guides the development of all activities. WSIPP's mission is to carry out practical research, at legislative direction, on issues of importance to Washington State.
